## Homework 3

## Abstract Algebra II

Complete the following problems. Note that you should only use results that we've discussed so far this semester or last semester.

For Problems 3-7, assume that $F$ is a field.
Problem 1. Let $R$ be a commutative ring with 1. Prove that a polynomial ring in more than one variable over $R$ is not a PID.

Problem 2. Consider the polynomial ring $\mathbb{Q}[x, y]$.
(a) Prove that the ideals $(x)$ and $(x, y)$ are prime in $\mathbb{Q}[x, y]$.
(b) Prove that $(x, y)$ is a maximal ideal but $(x)$ is not maximal.
(c) Prove that $(x, y)$ is not a principal ideal.

Problem 3. Prove that the rings $F[x, y] /\left(y^{2}-x\right)$ and $F[x, y] /\left(y^{2}-x^{2}\right)$ are not isomorphic for any field $F$.

Problem 4. Let $f(x) \in F[x]$ such that $\operatorname{deg}(f(x))=n \geq 1$. Prove that for each $\overline{g(x)} \in F[x] /(f(x))$ there is a unique $g_{0}(x) \in F[x]$ with $\operatorname{deg}\left(g_{0}(x)\right) \leq n-1$ such that $\overline{g(x)}=\overline{g_{0}(x)}$. Note: $\overline{g(x)}$ denotes passage to the quotient $F[x] /(f(x))$.

Problem 5. Let $f(x) \in F[x]$. Prove that $F[x] /(f(x))$ is a field iff $f(x)$ is irreducible.
Problem 6. Let $F$ be a finite field. Prove that $F[x]$ contains infinitely many primes. Hint: Mimic one of the well-known proofs that there are infinitely many primes in the natural numbers.

Problem 7. Prove that the set $R$ of polynomials in $F[x]$ whose coefficient of $x$ is equal to 0 is a subring of $F[x]$ and that $R$ is not a UFD. Hint: One approach is to find two distinct factorizations of $x^{6}$ into irreducibles.
