## Homework 6

Discrete Mathematics

Please review the Rules of the Game from the syllabus. Reviewing material from previous courses and looking up definitions and theorems you may have forgotten is fair game. Since mathematical reasoning, problem solving, and critical thinking skills are part of the learning outcomes of this course, all assignments should be prepared by the student. Developing strong competencies in this area will prepare you to be a lifelong learner and give you an edge in a competitive workplace. When it comes to completing assignments for this course, unless explicitly told otherwise, you should not look to resources outside the context of this course for help. That is, you should not be consulting the web (e.g., Chegg and Course Hero), generative artificial intelligence tools (e.g., ChatGPT), mathematics assistive technologies (e.g., Wolfram Alpha and Photomath), other texts, other faculty, or students outside of our course in an attempt to find solutions to the problems you are assigned. On the other hand, you may use each other, the textbook, me, and your own intuition. You are highly encouraged to seek out assistance by asking questions on Discord. You are allowed and encouraged to work together on homework. Yet, each student is expected to turn in their own work. If you feel you need additional resources, please come talk to me and we will come up with an appropriate plan of action.

In general, late homework will not be accepted. However, you are allowed to turn in up to two late homework assignments. Unless you have made arrangements in advance with me, homework turned in after class will be considered late.

Complete the following problems. Unless explicitly stated otherwise, you are expected to justify your answers. In many problems this means that you should use words to describe what you are doing and why. In other problems, simply providing sufficient arithmetic may be sufficient. If a problem asks you to count something, please box your final answer.

1. A convenience store stocks 8 types of candy bar.
(a) How many ways are there to pick 3 if no more than one of any type is allowed?
(b) How many ways are there to pick 3 if there is no such restriction?
2. Answer each of the following questions.
(a) How many integer solutions does $x+y+z+w=21$ have if $x, y, z, w \geq 0$ ?
(b) How many integer solutions does $x+y+z+w=21$ have if $x, y, z, w>0$ ?
(c) How many integer solutions does $x+y+z+w=21$ have if $x \geq 1, y \geq 2, z \geq 2, w \geq 0$ ?
(d) How many integer solutions does $x+y+z \leq 21$ have if $x, y, z \geq 0$ ?
3. A wishing well contains many coins, consisting of pennies, nickels, dimes, and quarters. A bucket is dipped into the well and retrieves 10 coins. How many different possible coin collections are there?
4. Define a multiset $M$ to be an unordered collection of elements that may be repeated. To distinguish between sets and multisets, we will use the notation $\}$ versus $\{\|\}$. For example, $M=\{a, a, a, b, c, c\}$ is a multiset (not to be confused with the set containing the set $\{a, b, c\}$; mathematical notation is both awesome and frustrating at times). The primes occurring in the prime factorization of a natural number greater than 1 is an example of multiset. The
cardinality of a multiset is its number of elements counted with multiplicity. So, in our example, $|M|=3+1+2=6$. If $S$ is a set, then $M$ is a multiset on $S$ if every element of $M$ is an element of $S$. For $n \geq 1$ and $k \geq 0$, define

$$
\left(\binom{n}{k}\right):=\text { number of multisets on }[n] \text { of size } k .
$$

Prove that

$$
\left(\binom{n}{k}\right)=\binom{n+k-1}{k} .
$$

Hint: Here is one possible approach. Construct a bijection from the collection of multisets on [ $n$ ] of size $k$ to the collection of subsets of $[n+k-1]$ of size $k$. To do this, assume your multisets on $[n]$ are canonically written in nondecreasing order, say $\left\{m_{1}, m_{2}, \ldots, m_{k} \|\right.$, where $m_{1} \leq m_{2} \leq \cdots \leq m_{k}$. Try to map each such multiset to a $k$-subset of $[n+k-1]$. You will need to make sure the elements in your image set are distinct.
